RESPONSE TO AMENDMENT

- 1. This Action is in response to the Amendment for Application Number 09/612,565 received on 11/15/2006.
- 2. Claims 1, 2, 4, 7, 8, 21, 22, 29, 31-41,44-46, 48, and 49 are presented for examination.
- 3. The prosecution of this case has been transferred to another Examiner. All corresponding communications should be directed to Examiner's contact information provided below.

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 11/15/2006 has been entered.

Claim Objections

Claim 49 is objected to because of the following informalities: Claim 49 reads "A storage medium according to claim 21". Examiner believes claim 49 may have been mistakenly dependent on claim 21, and should have been dependent on claim 29.

Appropriate correction is required.

Art Unit: 2143

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1, 4, 7, 21, 29, 31-41,44-46, 48, and 49 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gong et al. (U.S. 6,865,576) in view of lida (U.S. 2004/0196508).

4. Regarding claims 1, 7, 21, and 29, Gong disclosed a database schema for storing application data in a relational database backing store of a directory service in which the entries have multiple value attributes in the directory service in order to extend the LDAP attribute schema (Gong, col. 2, lines 40-55). Clients connect to multiple network databases through an LDAP server, in which the databases contain the directory information. From the user's prospective, the LDAP server stores all the information, and the user does not know the database in which the data is actually located (Gong, col. 4, lines 47-57). The server therefore has the ability to respond to client requests with multi-value attributes such as country code (Gong, col. 5, lines 25-36).

As explained in Applicant's instant specification, the LDAP protocol is used to "efficiently find various resources on [a] network, and utilize the resources... Therefore, by utilizing the directory service and searching the device connected to the network, a

Art Unit: 2143

list of network addresses of usable devices on the network can be obtained" (see Applicant's Specification, page 1, lines 10-20).

Since Gong uses an extended version of the LDAP protocol (Gong, col. 2, lines 45-50), it is inherent that when using the invention of Gong and making requests to the LDAP server, the LDAP server provides network addresses of the device.

Therefore, it is clear that based on a client request (Gong, col. 4, lines 58-67, client/server, and handling requests), the LDAP server of Gong provides both geographical location information (Gong, col. 5, lines 25-35, i.e. country code) and network addresses (Gong, col. 2, lines 40-45, the use of LDAP as explained above in reference to instant specification) in order to "provide end users with a rich information data warehouse that allows them to access department or company employee data, as well as resource information, such as name and <u>location</u> of printers, copy machines, and other environment resources.(Gong, col. 1, lines 30-40).

Gong did not explicitly state after receiving the information regarding the device, that the client goes out and connects to the device. However, it would have been obvious to one of ordinary skill in the art at the time the invention was made that the client would use this information for an actual purpose, such as actually using for example a printer (Gong, col. 1, lines 30-40) "and utilizing the resources" as admitted by the Applicant (See Applicant's instant Specification, page, 1, lines 10-29, using LDAP to find resources and "utilize them").

Art Unit: 2143

Gong did not explicitly state the device comprising storing icon data indicating an icon for visually representing said device, or a control unit, adapted to transmit the icon data to the client.

However, in an analogous art, lida disclosed a communication apparatus connected to a terminal via a network that detects information regarding the apparatus, including status information, stored on a memory of the apparatus (lida, Apstract) which provides the status information to the terminal, the status information, in one example, in the form of a printer status icon composed of a symbol mark for displaying a printer symbol (lida, paragraph 72).

Gong provides for an extended LDAP server for clients to locate devices, such as printers. Iida provides for a client connected to a device such as a printer. Since LDAP is used to locate devices such as printers and utilize their resources (see Applicant's Specification, page 1, lines 10-20), it would have been obvious to modify Gong to provide the resources of lida.

Therefore, it would have been obvious for one of ordinary skill in the art at the time the invention was made to modify the teachings of Gong to "utilize the resources" of the printer in lida, making it possible to present a status icon in which the latest status of the device is reflected to the client (lida, paragraph 16) to notify the client in a user friendly manner to indicate for instance, that the printer is out of paper (lida, paragraph 72).

Claim 1 includes a network system comprising a server, a client, and a device, each storage units, transmission units, reception units and control units to implement

Art Unit: 2143

the functionality explained above. While Gong does not explicitly point out such units, it is inherent that in order for the client and server to perform such functionality, that these units must exist. The client and server of Gong must include transmission units to send requests and responses, and they must also include storage to at least read/store the data. Otherwise, operation of the invention would not occur. Iida clearly shows the device having memory for storing the icon data and a control unit to transmit the icon data, as disclosed above.

Claim 7 recites an information processor (the client) including limitations that are substantially similar to the limitations in claim 1, and is therefore rejected under the same rationale.

Claim 21 recites a method of displaying an icon for a device, the method including limitations that are substantially similar to the limitations in claim 1, and is therefore rejected under the same rationale.

Claim 29 recites a storage medium storing program code including limitations that are substantially similar to the limitations in claim 1, and is therefore rejected under the same rationale.

5. Regarding claim 4, Gong and lida disclosed the limitations, substantially as claimed, as described in claim 1, including wherein said device further comprises a judgment unit, adapted to judge a status of said device, said second storage unit stores a plurality of icon data each of which corresponds to the status of said device, and said control unit selects the icon data in accordance with the judged status from the plurality

Art Unit: 2143

of stored icon data and transmits the selected icon data to said client (lida, see abstract, detecting updated status, paragraph 72, different icons representing different status).

Regarding claim 31, Gong and lida disclosed the limitations, substantially as claimed, as described in claim 1, including

Gong did not explicitly state after receiving the information regarding the device, wherein said client further comprises a processor unit adapted to process the received position information to identify a device corresponding to the received position information, and wherein said second transmission unit transmits the request to the identified device.

However, it would have been obvious to one of ordinary skill in the art at the time the invention was made that the client would use this received information for an actual purpose, such as actually using for example a printer (Gong, col. 1, lines 30-40) "and utilizing the resources" as admitted by the Applicant (See Applicant's instant Specification, page, 1, lines 10-29, using LDAP to find resources and "utilize them").

6. Regarding claims 32 and 36, Gong and Iida disclosed the limitations, substantially as claimed, as described in claims 1 and 21. Gong and Iida did not explicitly state wherein the position information indicates at least two geographical areas in which said device is located, a first one of the geographical areas being included within another of the geographical areas.

Art Unit: 2143

Page 8

However, it would have been obvious to one of ordinary skill in the art at the time the invention was made that based on one geographic location, one could determine an outer geographic location, for example, given the country code (Gong, col. 5, lines 25-36), one can determine what continent the country is located. Therefore, it would have been obvious to provide the continent as well. Therefore, it would have been obvious to one of ordinary skill in the art that if provided a location of a device, it would have been obvious to use the same functionality to provide a second location of that device.

- 7. Claims 33 and 37 include limitations substantially similar to claims 1 and 21, i.e. making a request to the device and receiving icon data from the device, and is therefore rejected under the same rationale as claim 1.
- 8. Claims 34 and 38 includes limitations substantially similar to claims 1 and 21, i.e. requesting a server to search for a desired device (LDAP) and receiving position information in response (explained in the above claim 1 rejection), and is therefore rejected under the same rationale as claim 1.
- 9. Claim 35 includes limitations substantially similar to claims 1, i.e. processing the received information to identify a device and making a request to the device, and is therefore rejected under the same rationale as claim 1.

Art Unit: 2143

- 10. Regarding claims 39, 40, 41 Gong and lida disclosed the limitations, substantially as claimed, as described in claims 1, 7, 21, including wherein said display unit displays the location of said device defined by the position information received by said first reception unit (Gong, col. 1, lines 30-40). Gong and lida did not explicitly state displaying the location in characters. However, using characters to display data was well known in the art at the time the invention was made. Therefore it was within the level of one of ordinary skill in the art to use characters to display this data as it was a standard practice at the time of the invention.
- 11. Regarding claim 44, Gong and Iida disclosed the limitations, substantially as claimed, as described in claim 1, including wherein the position information defining the geographical location of said device comprises information that defines the geographical location of said device in a plurality of hierarchical layers (Gong, col. 11, lines 15-25).
- Regarding claims 45, 46, 48, and 49, Gong and lida disclosed the limitations, substantially as claimed, as described in claim 1, 7, 21, 29, including wherein the position information defining the geographical location of said device comprises information selected from the group consisting of (a) information defining which of plural companies' facility said device is in, (b) information defining which of plural cities said device is in, (c) information defining which of plural building said device is in, (d) information defining which of plural floors of a building said device is on, and (e)

Art Unit: 2143

information defining which of plural locations on a floor said device is in (Gong, col. 1, lines 30-40).

Allowable Subject Matter

Claim 2, 8, 22 objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Conclusion

Examiner's Note: Examiner has cited particular columns and line numbers in the references applied to the claims above for the convenience of the applicant.

Although the specified citations are representative of the teachings of the art and are applied to specific limitations within the individual claim, other passages and figures may apply as well. It is respectfully requested from the applicant in preparing responses, to fully consider the references in entirety as potentially teaching all or part of the claimed invention, as well as the context of the passage as taught by the prior art or disclosed by the Examiner.

In the case of amending the claimed invention, Applicant is respectfully requested to indicate the portion(s) of the specification which dictate(s) the structure relied on for proper interpretation and also to verify and ascertain the metes and bounds of the claimed invention.

Art Unit: 2143
